

LIGHTING IMPACT ASSESSMENTS

Human and Ecology Receptors

Lighting Impact Assessments (LIA) and Lighting Environmental Statements (EIA) are key components in ensuring that your project meets both planning and environmental requirements. We understand that these early-stage documents must be tailored to fit your specific needs, whether that means providing a high-level overview with suggested mitigation measures or including a more detailed preliminary design. The latter allows for actual lighting results to be demonstrated, providing clarity to planning authorities and enabling ecologists to assess the precise impact once the lighting is in place.

With nearly four decades of experience, we've developed a unique expertise in creating designs that not only meet technical and regulatory standards but also work seamlessly with the environment. Our team has collaborated with Natural England and ecologists across the UK, developing a deep understanding of their needs and integrating ecology into every aspect of the design process from the outset. We're passionate about delivering lighting solutions that respect wildlife and the natural surroundings, always exploring every available measure to minimise ecological impacts. By addressing lighting impacts early and effectively, we ensure your project

We offer webinars and face to face training so you can design and condition for ecology and understand what goes into a Lighting Impact Assessment.. Delivered face to face, live, or through a downloadable link to watch when you choose.

Get in touch now, we can help deliver comprehensive LIA's, EIA lighting sections or training on this important aspect of the planning process.
